

先將老師的 image pull 使用老師給的 github 網站 ,到 終端 將以下全部的指令執行一次。

The screenshot shows a web browser window with the URL `github.com/sdwangntu/hadoop-cluster`. The page content includes instructions for pulling Docker images, creating an overlay network, launching the cluster, and launching a development container. Below the browser window, a terminal window is open, showing the execution of a Hadoop job. The terminal output displays a series of timestamps and counts, followed by the command to run the Hadoop job.

**Pull image from dockerhub**

- `docker pull sdwangntu/hive-metastore-db`
- `docker pull sdwangntu/hadoop3hbase-spark-hive`

**Create an attachable overlay network called for example "my-attachable-network"**

- `docker network create -d overlay --attachable my-attachable-network`

**Launch cluster: (note the "hadoop-master" hostname is required as it is, the "hadoop-worker" hostname can be renamed to others; the "mysql" hostname is used in the hive setting - hive-site.xml)**

- `docker run --hostname=mysql --name mysql --network my-attachable-network -d sdwangntu/hive-metastore-db`
- `docker run --hostname=hadoop-master --name hadoop-master --network my-attachable-network -d sdwangntu/hadoop3hbase-spark-hive`
- `docker run --hostname=hadoop-worker --name hadoop-worker --network my-attachable-network -d sdwangntu/hadoop3hbase-spark-hive`

Note the container execution order. And also check the startup routine "start-hadoop.sh" to see the roles played by each container.

**Launch a development container (this is a hadoop development container and is used for development and job submission) the "hadoop-dev" hostname is required as it is**

- `docker run --hostname=hadoop-dev --name hadoop-dev -v $(pwd):/home --network my-attachable-network -d sdwangntu/hadoop3hbase-spark-hive`

Terminal output:

用 hadoop 執行 mapping 與 reducer

```

執行成功，觀看其結果

Java 版本:

建立環境變數

```
export HADOOP_CLASSPATH=$JAVA_HOME/lib/tools.jar
```

compile java 程式:

```
hadoop com.sun.tools.javac.Main visitCount.java
```

```
jar cf vc.jar visitCount*.class
```

執行 hadoop:

```
hadoop jar vc.jar visitCount /tmp/visit_count/access_log
```

```
/tmp/visitCountJava_outdir
```
